Hammer for Coq: Automation for Dependent Type Theory

Łukasz Czajka, University of Copenhagen Cezary Kaliszyk, University of Innsbruck

29 March 2018

· Practical problem

- · Practical problem
 - · large parts of proofs are tedious

- · Practical problem
 - · large parts of proofs are tedious
- · Automation for Interactive Proof
 - · Proof search: intuition, firstorder,
 - Decision Procedures: congruence, fourier, ring, omega, SMTCoq, \dots

- Practical problem
 - · large parts of proofs are tedious
- · Automation for Interactive Proof
 - · Proof search: intuition, firstorder,
 - · Decision Procedures: congruence, fourier, ring, omega, SMTCoq, ...
- · AI/ATP techniques: Hammers
 - · MizAR for Mizar
 - · Sledgehammer for Isabelle/HOL
 - HOL(y)Hammer for HOL Light and HOL4
 - CoqHammer for Coq

· Hammer goal: provide efficient automated reasoning using facts from a large library.

- · Hammer goal: provide efficient automated reasoning using facts from a large library.
- · Strong relevance filtering.

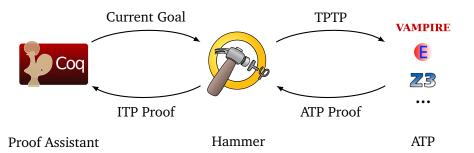

- · Hammer goal: provide efficient automated reasoning using facts from a large library.
- · Strong relevance filtering.
- · Usable library search "modulo simple reasoning".

- · Hammer goal: provide efficient automated reasoning using facts from a large library.
- · Strong relevance filtering.
- · Usable library search "modulo simple reasoning".
 - · We may not know the name of the lemma we want to apply.

- · Hammer goal: provide efficient automated reasoning using facts from a large library.
- · Strong relevance filtering.
- · Usable library search "modulo simple reasoning".
 - · We may not know the name of the lemma we want to apply.
 - There may be many equivalent formulations of the lemma which one is used in the library?

- · Hammer goal: provide efficient automated reasoning using facts from a large library.
- · Strong relevance filtering.
- · Usable library search "modulo simple reasoning".
 - · We may not know the name of the lemma we want to apply.
 - There may be many equivalent formulations of the lemma which one is used in the library?
 - The exact lemma may not exist in the library, but it may "trivially" follow from a few other lemmas in the library.

Hammer Overview

Hammers work in three phases.

 Using machine-learning and AI techniques perform premise-selection: select about a few hundred to 1-2 thousand lemmas that are likely to be needed in the proof of the conjecture.

- Using machine-learning and AI techniques perform premise-selection: select about a few hundred to 1-2 thousand lemmas that are likely to be needed in the proof of the conjecture.
- Translate the selected lemmas, together with the conjecture, from the logic of the ITP to a format accepted by powerful external automated theorem provers (ATPs) – most commonly untyped first-order logic with equality.

- Using machine-learning and AI techniques perform premise-selection: select about a few hundred to 1-2 thousand lemmas that are likely to be needed in the proof of the conjecture.
- **Translate** the selected lemmas, together with the conjecture, from the logic of the ITP to a format accepted by powerful external automated theorem provers (ATPs) most commonly untyped first-order logic with equality. Run the ATP(s) on the result of the translation.

- Using machine-learning and AI techniques perform
 premise-selection: select about a few hundred to 1-2 thousand
 lemmas that are likely to be needed in the proof of the conjecture.
- **Translate** the selected lemmas, together with the conjecture, from the logic of the ITP to a format accepted by powerful external automated theorem provers (ATPs) most commonly untyped first-order logic with equality. Run the ATP(s) on the result of the translation.
- **Reprove** the conjecture in the logic of the ITP, using the information obtained in the ATP runs.

- Using machine-learning and AI techniques perform premise-selection: select about a few hundred to 1-2 thousand lemmas that are likely to be needed in the proof of the conjecture.
- **Translate** the selected lemmas, together with the conjecture, from the logic of the ITP to a format accepted by powerful external automated theorem provers (ATPs) most commonly untyped first-order logic with equality. Run the ATP(s) on the result of the translation.
- **Reprove** the conjecture in the logic of the ITP, using the information obtained in the ATP runs. Typically, a list of (usually a few) lemmas needed by an ATP to prove the conjecture is obtained from an ATP run, and we try to reprove the goal from these lemmas.

CoqHammer demo

examples/imp.v

CoqHammer: premise selection

· Learning done each time the plugin is invoked (to include *all* accessible facts).

CoqHammer: premise selection

- · Learning done each time the plugin is invoked (to include *all* accessible facts).
- · Two machine-learning filters: k-NN and naive Bayes.

CoqHammer: premise selection

- · Learning done each time the plugin is invoked (to include *all* accessible facts).
- · Two machine-learning filters: k-NN and naive Bayes.
- · Re-uses the HOLyHammer efficient implementation (also adapted by Sledgehammer).

Translation: target logic

Target logic: untyped FOL with equality.

Three functions \mathcal{F} , \mathcal{G} , and \mathcal{C} .

• \mathscr{F} : propositions \rightarrow FOL formulas used for CIC₀ terms of type Prop.

• \mathcal{G} : types \rightarrow guards used for CIC₀ terms of type Type.

· \mathscr{C} : all $CIC_0 \rightarrow FOL$ terms

· The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.

- · The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.
 - · If $\Gamma \vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \mathscr{F}_{\Gamma}(t) \to \mathscr{F}_{\Gamma,x:t}(s)$.
 - · If $\Gamma \not\vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \forall x. \mathscr{G}_{\Gamma}(t,x) \to \mathscr{F}_{\Gamma,x:t}(s)$.

· The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.

```
· If \Gamma \vdash t: Prop then \mathscr{F}_{\Gamma}(\Pi x : t.s) = \mathscr{F}_{\Gamma}(t) \to \mathscr{F}_{\Gamma,x:t}(s).
· If \Gamma \not\vdash t: Prop then \mathscr{F}_{\Gamma}(\Pi x : t.s) = \forall x.\mathscr{G}_{\Gamma}(t,x) \to \mathscr{F}_{\Gamma,x:t}(s).
```

· The function $\mathcal G$ encodes types as guards and is used for terms of Coq which have type Type.

· The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.

```
· If \Gamma \vdash t: Prop then \mathscr{F}_{\Gamma}(\Pi x : t.s) = \mathscr{F}_{\Gamma}(t) \to \mathscr{F}_{\Gamma,x:t}(s).
· If \Gamma \not\vdash t: Prop then \mathscr{F}_{\Gamma}(\Pi x : t.s) = \forall x.\mathscr{G}_{\Gamma}(t,x) \to \mathscr{F}_{\Gamma,x:t}(s).
```

· The function \mathcal{G} encodes types as guards and is used for terms of Coq which have type Type.

$$\mathcal{G}(\tau, f) = \forall x. \mathcal{G}(\alpha, x) \to \mathcal{G}(\beta(x), fx)$$

· The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.

· If
$$\Gamma \vdash t$$
: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \mathscr{F}_{\Gamma}(t) \to \mathscr{F}_{\Gamma,x:t}(s)$.
· If $\Gamma \not\vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \forall x.\mathscr{G}_{\Gamma}(t,x) \to \mathscr{F}_{\Gamma,x:t}(s)$.

· The function $\mathcal G$ encodes types as guards and is used for terms of Coq which have type Type.

For instance, for a (closed) type $\tau = \Pi x : \alpha.\beta(x)$ we have

$$\mathcal{G}(\tau, f) = \forall x. \mathcal{G}(\alpha, x) \to \mathcal{G}(\beta(x), fx)$$

· The function $\mathscr C$ encodes Coq terms as FOL terms.

- · The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.
 - · If $\Gamma \vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \mathscr{F}_{\Gamma}(t) \to \mathscr{F}_{\Gamma,x:t}(s)$. · If $\Gamma \not\vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \forall x.\mathscr{G}_{\Gamma}(t,x) \to \mathscr{F}_{\Gamma,x:t}(s)$.
- · The function \mathcal{G} encodes types as guards and is used for terms of Coq which have type Type.

$$\mathscr{G}(\tau, f) = \forall x. \mathscr{G}(\alpha, x) \to \mathscr{G}(\beta(x), fx)$$

- · The function $\mathscr C$ encodes Coq terms as FOL terms.
 - $\mathscr{C}_{\Gamma}(ts)$ is equal to:

- · The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.
 - · If $\Gamma \vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \mathscr{F}_{\Gamma}(t) \to \mathscr{F}_{\Gamma,x:t}(s)$. · If $\Gamma \not\vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \forall x.\mathscr{G}_{\Gamma}(t,x) \to \mathscr{F}_{\Gamma,x:t}(s)$.
- · The function $\mathcal G$ encodes types as guards and is used for terms of Coq which have type Type.

$$\mathcal{G}(\tau, f) = \forall x. \mathcal{G}(\alpha, x) \to \mathcal{G}(\beta(x), fx)$$

- · The function $\mathscr C$ encodes Coq terms as FOL terms.
 - $\mathscr{C}_{\Gamma}(ts)$ is equal to:
 - $\cdot \ \varepsilon \text{ if } \Gamma \vdash ts : \alpha : \text{Prop},$

- · The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.
 - · If $\Gamma \vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \mathscr{F}_{\Gamma}(t) \to \mathscr{F}_{\Gamma,x:t}(s)$. · If $\Gamma \not\vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \forall x.\mathscr{G}_{\Gamma}(t,x) \to \mathscr{F}_{\Gamma,x:t}(s)$.
- · The function \mathcal{G} encodes types as guards and is used for terms of Coq which have type Type.

$$\mathscr{G}(\tau, f) = \forall x. \mathscr{G}(\alpha, x) \to \mathscr{G}(\beta(x), fx)$$

- · The function $\mathscr C$ encodes Coq terms as FOL terms.
 - $\mathscr{C}_{\Gamma}(ts)$ is equal to:
 - ε if $\Gamma \vdash ts : \alpha : Prop,$
 - · $\mathscr{C}_{\Gamma}(t)$ if $\Gamma \vdash s : \alpha : \text{Prop}$,

- · The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.
 - · If $\Gamma \vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \mathscr{F}_{\Gamma}(t) \to \mathscr{F}_{\Gamma,x:t}(s)$. · If $\Gamma \not\vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \forall x.\mathscr{G}_{\Gamma}(t,x) \to \mathscr{F}_{\Gamma,x:t}(s)$.
- · The function $\mathcal G$ encodes types as guards and is used for terms of Coq which have type Type.

$$\mathcal{G}(\tau, f) = \forall x. \mathcal{G}(\alpha, x) \to \mathcal{G}(\beta(x), fx)$$

- · The function $\mathscr C$ encodes Coq terms as FOL terms.
 - · $\mathscr{C}_{\Gamma}(ts)$ is equal to:
 - ε if $\Gamma \vdash ts : \alpha : \text{Prop}$,
 - · $\mathscr{C}_{\Gamma}(t)$ if $\Gamma \vdash s : \alpha : \text{Prop}$,
 - · $\mathscr{C}_{\Gamma}(t)\mathscr{C}_{\Gamma}(s)$ otherwise.

- · The function \mathcal{F} encodes propositions as FOL formulas and is used for terms of Coq having type Prop.
 - · If $\Gamma \vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \mathscr{F}_{\Gamma}(t) \to \mathscr{F}_{\Gamma,x:t}(s)$. · If $\Gamma \not\vdash t$: Prop then $\mathscr{F}_{\Gamma}(\Pi x : t.s) = \forall x.\mathscr{G}_{\Gamma}(t,x) \to \mathscr{F}_{\Gamma,x:t}(s)$.
- · The function \mathcal{G} encodes types as guards and is used for terms of Coq which have type Type.

$$\mathcal{G}(\tau, f) = \forall x. \mathcal{G}(\alpha, x) \to \mathcal{G}(\beta(x), fx)$$

- · The function $\mathscr C$ encodes Coq terms as FOL terms.
 - · $\mathscr{C}_{\Gamma}(ts)$ is equal to:
 - · ε if $\Gamma \vdash ts : \alpha : Prop,$
 - · $\mathscr{C}_{\Gamma}(t)$ if $\Gamma \vdash s : \alpha : \text{Prop}$,
 - · $\mathscr{C}_{\Gamma}(t)\mathscr{C}_{\Gamma}(s)$ otherwise.
 - $\mathscr{C}_{\Gamma}(\lambda \vec{x}:\vec{t}.s) = F\vec{y}$ where s does not start with a lambda-abstraction any more, F is a fresh constant, $\vec{y} = FV(\lambda \vec{x}:\vec{t}.s)$ and $\forall \vec{y}.\mathscr{F}_{\Gamma}(\forall \vec{x}:\vec{t}.F\vec{y}\vec{x}=s)$ is a new axiom.

ATP invocation

· We use Vampire, E prover, and Z3.

ATP invocation

- · We use Vampire, E prover, and Z3.
- The provers may be run in parallel with different numbers of premises and premise selection methods.

Proof reconstruction

· Use dependencies from a successful ATP run.

Proof reconstruction

- · Use dependencies from a successful ATP run.
- · Do automatic proof search using different versions of our tactics (implemented in Ltac), with a fixed time limit for each.

Proof reconstruction

- · Use dependencies from a successful ATP run.
- · Do automatic proof search using different versions of our tactics (implemented in Ltac), with a fixed time limit for each.
- · 85% of proofs reconstructed.

Overall hammer evaluation

All statements from the Coq standard libary

ATP success 50%

· ATPs used: E, Z3, Vampire with 30 seconds time limit

Overall success 40.8%

 8 threads with different lemma selection, premises, provers, reconstruction

Conclusion

· Proof length already close to that of Isabelle/HOL.

Conclusion

- · Proof length already close to that of Isabelle/HOL.
- · Improvements needed for dependent types and boolean reflection.
