Robust Strategy Schedule Optimization for an Automatic Theorem Prover

Filip Bártek and Martin Suda

Czech Technical University in Prague, Czech Republic

AITP, September 2023

(ロ) (日) (日) (日) (日) (日) (1/12)

State-of-the-art automatic theorem provers for FOL:

• e.g.: E, iProver, Vampire

State-of-the-art automatic theorem provers for FOL:

- e.g.: E, iProver, Vampire
- many, many ways to configure the search for a proof

< □ > < @ > < E > < E > E = のQで 1/12

State-of-the-art automatic theorem provers for FOL:

- e.g.: E, iProver, Vampire
- many, many ways to configure the search for a proof
- one such configuration = strategy

State-of-the-art automatic theorem provers for FOL:

- e.g.: E, iProver, Vampire
- many, many ways to configure the search for a proof
- one such configuration = strategy
 "We define a strategy by fixing values of proof search options"

< □ > < @ > < E > < E > E = のQで 1/12

State-of-the-art automatic theorem provers for FOL:

- e.g.: E, iProver, Vampire
- many, many ways to configure the search for a proof
- one such configuration = strategy
 "We define a strategy by fixing values of proof search options"

Already Gandalf [Tammet98] knew that:

• there is no single best universal strategy

State-of-the-art automatic theorem provers for FOL:

- e.g.: E, iProver, Vampire
- many, many ways to configure the search for a proof
- one such configuration = strategy
 "We define a strategy by fixing values of proof search options"

Already Gandalf [Tammet98] knew that:

- there is no single best universal strategy
- it pays off to prepare a whole <u>schedule</u> of strategies to try on a problem and execute them in succession (or in parallel)

State-of-the-art automatic theorem provers for FOL:

- e.g.: E, iProver, Vampire
- many, many ways to configure the search for a proof
- one such configuration = strategy
 "We define a strategy by fixing values of proof search options"

Already Gandalf [Tammet98] knew that:

- there is no single best universal strategy
- it pays off to prepare a whole <u>schedule</u> of strategies to try on a problem and execute them in succession (or in parallel)
- many short runs of <u>complementary</u> strategies will usually beat a single long run of a in-theory-complete single strategy

State-of-the-art automatic theorem provers for FOL:

- e.g.: E, iProver, Vampire
- many, many ways to configure the search for a proof
- one such configuration = strategy
 "We define a strategy by fixing values of proof search options"

Already Gandalf [Tammet98] knew that:

- there is no single best universal strategy
- it pays off to prepare a whole <u>schedule</u> of strategies to try on a problem and execute them in succession (or in parallel)
- many short runs of <u>complementary</u> strategies will usually beat a single long run of a in-theory-complete single strategy

SnakeForV4.7: a strategy discovery and schedule construction tool applied to Vampire 4.7 (and running in demonstration-only mode)

"Spider was used since 2010 and has been a secret weapon behind Vampire's success at the CASC competitions."

"Spider was used since 2010 and has been a secret weapon behind Vampire's success at the CASC competitions."

What we know about Spider:

"Spider was used since 2010 and has been a secret weapon behind Vampire's success at the CASC competitions."

What we know about Spider:

• tries out random strategies to solve medium to hard problems

< □ > < @ > < E > < E > E = のQで 3/12

"Spider was used since 2010 and has been a secret weapon behind Vampire's success at the CASC competitions."

What we know about Spider:

- tries out random strategies to solve medium to hard problems
- locally optimizes a strategy just for its problem (preferring default values where the choice seems irrelevant)

"Spider was used since 2010 and has been a secret weapon behind Vampire's success at the CASC competitions."

What we know about Spider:

- tries out random strategies to solve medium to hard problems
- locally optimizes a strategy just for its problem (preferring default values where the choice seems irrelevant)

< □ > < @ > < E > < E > E = のQで 3/12

• once done, evaluates a strategy on all problems

"Spider was used since 2010 and has been a secret weapon behind Vampire's success at the CASC competitions."

What we know about Spider:

- tries out random strategies to solve medium to hard problems
- locally optimizes a strategy just for its problem (preferring default values where the choice seems irrelevant)
- once done, evaluates a strategy on all problems
- poses schedule construction as an optimization problem: "Cover all known-to-be-solvable problems by a subset of strategies with their time limits summing up to ≤ K."

"Spider was used since 2010 and has been a secret weapon behind Vampire's success at the CASC competitions."

What we know about Spider:

- tries out random strategies to solve medium to hard problems
- locally optimizes a strategy just for its problem (preferring default values where the choice seems irrelevant)
- once done, evaluates a strategy on all problems
- poses schedule construction as an optimization problem: "Cover all known-to-be-solvable problems by a subset of strategies with their time limits summing up to ≤ K."

General mindset:

"Spider was used since 2010 and has been a secret weapon behind Vampire's success at the CASC competitions."

What we know about Spider:

- tries out random strategies to solve medium to hard problems
- locally optimizes a strategy just for its problem (preferring default values where the choice seems irrelevant)
- once done, evaluates a strategy on all problems
- poses schedule construction as an optimization problem: "Cover all known-to-be-solvable problems by a subset of strategies with their time limits summing up to ≤ K."

General mindset:

• Computationally not cheap: get some CPUs and use them!

"Spider was used since 2010 and has been a secret weapon behind Vampire's success at the CASC competitions."

What we know about Spider:

- tries out random strategies to solve medium to hard problems
- locally optimizes a strategy just for its problem (preferring default values where the choice seems irrelevant)
- once done, evaluates a strategy on all problems
- poses schedule construction as an optimization problem: "Cover all known-to-be-solvable problems by a subset of strategies with their time limits summing up to ≤ K."

General mindset:

- Computationally not cheap: get some CPUs and use them!
- Don't bother with any form of ML-powered "strategy selection"

• Andrei, as the sole operator of Spider, was getting increasingly busy with EasyChair in recent recent years

• Andrei, as the sole operator of Spider, was getting increasingly busy with EasyChair in recent recent years

• CASC schedule of Vampire 4.7 used in 2022 was from 2019!

- Andrei, as the sole operator of Spider, was getting increasingly busy with EasyChair in recent recent years
- CASC schedule of Vampire 4.7 used in 2022 was from 2019!
- so we decided to develop our own tool to try out new ideas and gain flexibility / independence

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

- Andrei, as the sole operator of Spider, was getting increasingly busy with EasyChair in recent recent years
- CASC schedule of Vampire 4.7 used in 2022 was from 2019!
- so we decided to develop our own tool to try out new ideas and gain flexibility / independence

What's new in Snake?

- Andrei, as the sole operator of Spider, was getting increasingly busy with EasyChair in recent recent years
- CASC schedule of Vampire 4.7 used in 2022 was from 2019!
- so we decided to develop our own tool to try out new ideas and gain flexibility / independence

What's new in Snake?

• stochastic view of strategies treated as Las Vegas algorithms

< □ > < @ > < E > < E > E = のQで 4/12

- Andrei, as the sole operator of Spider, was getting increasingly busy with EasyChair in recent recent years
- CASC schedule of Vampire 4.7 used in 2022 was from 2019!
- so we decided to develop our own tool to try out new ideas and gain flexibility / independence

What's new in Snake?

- stochastic view of strategies treated as Las Vegas algorithms
- local strategy improvement with many random probes

- Andrei, as the sole operator of Spider, was getting increasingly busy with EasyChair in recent recent years
- CASC schedule of Vampire 4.7 used in 2022 was from 2019!
- so we decided to develop our own tool to try out new ideas and gain flexibility / independence

What's new in Snake?

- stochastic view of strategies treated as Las Vegas algorithms
- local strategy improvement with many random probes
- greedy weighted cover for the schedule creation phase

So who is the Snake?

So who is the Snake?

Warning: CASC's TPTP problems threatened to be shuffled!

Warning: CASC's TPTP problems threatened to be shuffled!

A 2019 experiment

Use tptp4X -trandomize from the TPTP toolset to:

- randomize the order of commutative logical operations
- randomize the order of formulas

Warning: CASC's TPTP problems threatened to be shuffled!

A 2019 experiment

Use tptp4X -trandomize from the TPTP toolset to:

- randomize the order of commutative logical operations
- randomize the order of formulas

Can we solve more problems? (with a single strategy)

A 2019 experiment

Use ${\tt tptp4X}$ -trandomize from the TPTP toolset to:

- randomize the order of commutative logical operations
- randomize the order of formulas

Can we solve more problems? (with a single strategy)

configuration	solved	uniques	additional
straight	8612	53	8612
shuffled1	8773	60	345
shuffled2	8788	85	128
shuffled3	8775	48	48

A 2019 experiment

Use tptp4X -trandomize from the TPTP toolset to:

- randomize the order of commutative logical operations
- randomize the order of formulas

Can we solve more problems? (with a single strategy)

configuration	solved	uniques	additional
straight	8612	53	8612
shuffled1	8773	60	345
shuffled2	8788	85	128
shuffled3	8775	48	48

Can now be invoked from Vampire (--shuffle_input on) as well as "internal" shuffling (--random_traversals on)

Step 1: Random Strategies to Discover New Solutions

Our Strategy Space

<ロト < 母 > < 臣 > < 臣 > 王 = の Q @ 7/12
Our Strategy Space

 $\bullet\,\sim$ 100 options: bool, categorical, numerical, ratios

Our Strategy Space

 $\bullet\,\sim$ 100 options: bool, categorical, numerical, ratios

- iterate over all (non-default) options for several rounds

Optimization criteria

does the probability of solving the problem improve?

- 2 does the time to solve the problem improve?
- odes the new value look more reasonable?

- vary one option at a time
- iterate over all (non-default) options for several rounds

Optimization criteria

does the probability of solving the problem improve?

- 2 does the time to solve the problem improve?
- odes the new value look more reasonable?

DEMO: protocol.txt

DEMO cont.: an AWR Plot

So now we have all the discovered strategies evaluated on all the problems of interest: E_p^s , for $s \in Strats$ and $p \in Probs$.

So now we have all the discovered strategies evaluated on all the problems of interest: E_p^s , for $s \in Strats$ and $p \in Probs$.

Weighted set cover formulation:

• define sets: $S_{(s,i)} = \{p \| E_p^s \le i\}$ with weights $w_{(s,i)} = i$

▲□▶ ▲@▶ ▲ 볼▶ ▲ 볼▶ 볼| 볼 ∽ ९ ℃ 10/12

So now we have all the discovered strategies evaluated on all the problems of interest: E_p^s , for $s \in Strats$ and $p \in Probs$.

Weighted set cover formulation:

- define sets: $S_{(s,i)} = \{p \| E_p^s \le i\}$ with weights $w_{(s,i)} = i$
- problems covered by a schedule $S: c(S) = \bigcup_{(s,i)\in S} S_{(s,i)}$

So now we have all the discovered strategies evaluated on all the problems of interest: E_p^s , for $s \in Strats$ and $p \in Probs$.

Weighted set cover formulation:

- define sets: $S_{(s,i)} = \{p \| E_p^s \le i\}$ with weights $w_{(s,i)} = i$
- problems covered by a schedule $S: c(S) = \bigcup_{(s,i)\in S} S_{(s,i)}$
- task: find a schedule \mathcal{S} covering all solvable problems:

$$c(\mathcal{S}) = \bigcup_{s \in Strats} \{ p \| E_{\rho}^{s} < \infty \},$$

<□ → < □ → < Ξ → < Ξ → Ξ = の Q ↔ 10/12</p>

minimizing the cost $\sum_{(s,i)\in S} w_{(s,i)}$

So now we have all the discovered strategies evaluated on all the problems of interest: E_p^s , for $s \in Strats$ and $p \in Probs$.

Weighted set cover formulation:

- define sets: $S_{(s,i)} = \{p \| E_p^s \le i\}$ with weights $w_{(s,i)} = i$
- problems covered by a schedule $S: c(S) = \bigcup_{(s,i)\in S} S_{(s,i)}$
- task: find a schedule \mathcal{S} covering all solvable problems:

$$c(\mathcal{S}) = \bigcup_{s \in Strats} \{ p \| E_p^s < \infty \},$$

minimizing the cost $\sum_{(s,i)\in S} w_{(s,i)}$

Greedy Weighted Set Cover

Starting with the empty schedule $S = \emptyset$ Loop adding to S an (s, i) maximizing $|S_{(s,i)} \setminus c(S)| / w_{(s,i)}$

▲□▶ < @▶ < 분▶ < 분▶ 원들 < 외 < 10/12

• If, at the end, both $(s, i) \in S$ and $(s, j) \in S$ for i < j, we can drop (s, i) since, after all, $S_{(s,i)} \subseteq S_{(s,j)}$

• If, at the end, both $(s, i) \in S$ and $(s, j) \in S$ for i < j, we can drop (s, i) since, after all, $S_{(s,i)} \subseteq S_{(s,j)}$

<□> <@> < E> < E> EIE のQC 11/12

• Redefine schedule to $\mathcal{S}: \mathit{Strats} \to \mathbb{N}$

- If, at the end, both $(s, i) \in S$ and $(s, j) \in S$ for i < j, we can drop (s, i) since, after all, $S_{(s,i)} \subseteq S_{(s,j)}$
- Redefine schedule to $S: Strats \rightarrow \mathbb{N}$ (starting as constant 0)

<□> <@> < E> < E> EIE のQC 11/12

- If, at the end, both $(s, i) \in S$ and $(s, j) \in S$ for i < j, we can drop (s, i) since, after all, $S_{(s,i)} \subseteq S_{(s,j)}$
- Redefine schedule to $S: Strats \rightarrow \mathbb{N}$ (starting as constant 0)
- and adapt the costs as we go:

if
$$S(s) = i$$
 then set $w_{(s,j)} = \max(0, j - i)$

<□> <@> < E> < E> EIE のQC 11/12

- If, at the end, both $(s, i) \in S$ and $(s, j) \in S$ for i < j, we can drop (s, i) since, after all, $S_{(s,i)} \subseteq S_{(s,j)}$
- Redefine schedule to $S: Strats \rightarrow \mathbb{N}$ (starting as constant 0)
- and adapt the costs as we go:

if
$$S(s) = i$$
 then set $w_{(s,i)} = \max(0, j - i)$

Actually, can aim to construct a "probabilistic" schedule

- If, at the end, both $(s, i) \in S$ and $(s, j) \in S$ for i < j, we can drop (s, i) since, after all, $S_{(s,i)} \subseteq S_{(s,j)}$
- Redefine schedule to $S: Strats \rightarrow \mathbb{N}$ (starting as constant 0)
- and adapt the costs as we go:

if
$$S(s) = i$$
 then set $w_{(s,i)} = \max(0, j - i)$

Actually, can aim to construct a "probabilistic" schedule
Collect more data:

- If, at the end, both $(s, i) \in S$ and $(s, j) \in S$ for i < j, we can drop (s, i) since, after all, $S_{(s,i)} \subseteq S_{(s,j)}$
- Redefine schedule to $S: Strats \rightarrow \mathbb{N}$ (starting as constant 0)
- and adapt the costs as we go:

if
$$S(s) = i$$
 then set $w_{(s,j)} = \max(0, j-i)$

Actually, can aim to construct a "probabilistic" schedule
Collect more data: e.g., (s, i) solves p with probability 0.8

- If, at the end, both $(s, i) \in S$ and $(s, j) \in S$ for i < j, we can drop (s, i) since, after all, $S_{(s,i)} \subseteq S_{(s,j)}$
- Redefine schedule to $S: Strats \rightarrow \mathbb{N}$ (starting as constant 0)
- and adapt the costs as we go:

if
$$S(s) = i$$
 then set $w_{(s,j)} = \max(0, j - i)$

Actually, can aim to construct a "probabilistic" schedule

- Collect more data: e.g., (s, i) solves p with probability 0.8
- Assuming strategy independence: if current S solves p with prob. 0.5, adding (s, i) to S will improve by 0.8 ⋅ 0.5 to 0.9

How could Snake be more robust?

 randomization during minimization (the step 2) tends to make a strategy s robustly successful on its p

Thank you! < D > (B > (E > E) =) < C 12/12

Clause Selection and Age-weight Ratio

Vampire alternates between selecting the next given clause by age (old first) and by weight (light first) under a given ratio.

Clause Selection and Age-weight Ratio

Vampire alternates between selecting the next given clause by age (old first) and by weight (light first) under a given ratio.

Normally, this alternation is regular. What if we change it to probabilistic?
